

ExamShield - BI Report & Data Description

Dashboard content, KPI definitions, data model and interview-ready explanation

1. Dashboard objective

The report is designed as an operational control-tower concept. It separates source-backed facts from a synthetic centre model so the portfolio demonstrates research discipline without presenting invented centre-level values as real-world findings.

2. KPI definitions

KPI	Value / logic	Data status
NEET registered candidates	22.79 lakh	Source-backed
NEET centres	5,432+	Source-backed
Observers	6,000+	Source-backed
SSC affected / re-exam candidates	76,153	Secondary / RTI context
Public evidence events	14	Portfolio evidence register
Illustrative centre-days	240	Synthetic
Proposed risk score	0-100 weighted control index	Synthetic / proposed

3. Dashboard pages

Page 1 - Executive Control View: KPI cards, public evidence timeline, illustrative centre-risk distribution, control-gap indicators and key BA insights.

Page 2 - Centre Risk Detail: centre, city, date, candidate volume, control indicators, incidents, complaints, response time and proposed risk band.

Page 3 - Future-State Requirements: current-state/future-state process, stakeholder needs, data requirements, alert rules and governance.

4. Data model

Table	Purpose	Key fields
Public_Evidence	Research / source-backed event register	Event_ID, Date, Geography, Exam, Event_Category, Pune_
Sources	Traceability to evidence	Source_ID, Publisher, Title, URL, Key_Fact
Illustrative_Operations	Synthetic centre-level analytics model	Centre_ID, City, Exam_Date, Controls, Incidents, Complaints
Data_Dictionary	Definitions and caveats	Field, Table, Type, Business meaning, Rule

5. Proposed risk-score logic

The synthetic model combines control gaps and incident indicators. The weights are a portfolio proposal, not a government standard: CCTV gap 22%, biometric exception exposure 18%, network downtime 16%, frisking gap 16%, chain-of-custody gap 16%, staffing gap 8%, complaints 4%. Illustrative bands are **Low <18, Watch 18-27.9, High 28-34.9, Critical 35+**.

6. Why this is a BA project

- Stakeholder mapping - Examination Controller, Regional Operations, Centre Superintendent, IT Operations, Security/Surveillance, Compliance/Audit, Candidate Support.
- Requirements - define what each stakeholder needs to see, how often, and what action should follow an exception.

- Process analysis - map planning, custody, centre execution, incident, investigation and recovery.
- Analytics - convert control data into KPIs, exception lists and risk views.
- Data governance - preserve source lineage and document observed vs synthetic data.
- Future state - move from event-by-event reporting toward an exception-based control tower.

7. Screenshot showcase rule

The supplied image is a **static Power BI-style portfolio mockup**, not an exported live Power BI file. On LinkedIn/GitHub, label it as a proposed Power BI dashboard / report mockup. Do not claim production deployment.

8. Data limitations

- Public sources do not provide a complete centre-by-centre incident dataset for NEET-UG 2026.
- Public reports are heterogeneous: security-control descriptions, allegations, investigation milestones and operational disruptions are different evidence states.
- The 76,153 SSC figure is a reported re-examination figure in secondary reporting, not a market-wide examination-failure rate.
- Synthetic centre-level data is for demonstration only.
